- The nomenclature indicates the grain and spot, respectively, of the analyzed monazite. ET= Everest transect sample; 85H20g = see Hubbard (1989) for pressure and temperature information for this sample; GM74 was collected by Metcalfe (1993). See Figure 2 for sample locations.
- Measured ratio in sample.
- Average ratio of multiple analyses of the standard grains (monazite 554; Harrison et al., 1995). Samples that have two entries (ET19, 85H20g) represent two days of analyses.
- Percent radiogenically derived  $^{208}\text{Pb}$ .
- Corrected sample ratio assuming  $^{208}\text{Pb}/^{204}\text{Pb}=39.5\pm 0.1$  (Stacey and Kramers, 1975).
- Averages ( $\pm 1\sigma$ ) of numerical results for the sample listed above are seen in bold.
- Monazite inclusion in garnet.
- Calculations exclude some analyses. ET18b age summary excludes 9\_1, 4\_1, and 4\_2. Summary for ET26 includes only the Miocene monazite ages. No attempt was made to average the numerical results for the ET19 monazites.
